Cable entry systems

The cable entry system is a combination of cable entry frame and captive split inserts. The extraordinary advantage for all kinds of applications is the consequential split of the system, which enables a retro-fit of pre-fabricated cables and wires. Cables with different diameters can be installed using the captive split inserts.

Supplier-warranty of pre-fabricated cables remains valid, as connectors do not have to be unsoldered and then soldered on again.

Innovations in EMC-technology

In machine building and plant construction all parts are exposed to electro-magnetic noise because of numerous control units. Typical examples for sources of interference are motors, compressors, welding installations, as well as components using phase controlled modulation.

In this environment, long cables are used for transmission of sensor signals or data interchange. Therefore screened cables have prevailed. For draining of interferences on cable shields, Icotek EMC products are the answer.

Contact your local Application Engineer at Airline for these and other automation solutions.
