Board Level Design & Fabrication

Airline's in-house capabilities provide design of board level products that facilitate controls and automation solutions.

- (1) Encoder-servo amplifier interface circuit board utilized in conjunction with cam positioner encoder and servo motors to provide a coordinated five axis following system for the production of decorative boxes.
- (2) Amplifier encoder-PLC interface provides encoder line driver output to open collector conversion for interfacing to PLCs to provide closed loop position control.
- (3) Non-contacting temperature measurement array utilizing infrared-sensing technology in conjunction with a PLC, for the purpose of sorting Pyrex, ceramic and glass in a recycling operation.
